5.111 Lecture Summary #30 <u>Transition Metals</u> <u>Topic: Crystal Field Theory and the Spectrochemical Series.</u> Chapter 16

<u>A molecule's color</u> can depend on oxidation state or liganded state. Example: oscillating clock. Consider the overall reaction:

$IO_3^+ + 2 H_2O_2 + CH_2(CO_2H)_2 + H^+ \rightarrow ICH(CO_2H)_2 + 2 O_2 + 3 H_2O_2$

The overall reaction can be broken into two components (1 and 2), the second of which can be further divided into components (a and b):

(1) $IO_3^- + 2 H_2O_2 + H^+ \rightarrow HOI + 2 O_2 + 2 H_2O$ what is happening to "I"?

(Note that the HOI produced in the first reaction is a reactant in the second reaction.)

(2) HOI + $CH_2(CO_2H)_2 \rightarrow ICH(CO_2H)_2 + H_2O$

(a) $\Gamma + HOI + H^+ \rightarrow I_2 + H_2O$ what is being oxidized and what is being reduced in this reaction?

(b) $I_2CH_2(CO_2H)_2 \rightarrow ICH_2(CO_2H)_2 + H^+ + \Gamma$

As this reaction proceeds, the color will oscillate from clear to amber to deep blue. Specifically, I is clear. The amber color is from I_2 formation. The deep blue color results from the I and I_2 binding to the starch present in the solution. Thus, the color of iodine depends on its oxidation state and its liganded state (whether or not it is bound to starch).

Transition metal coordination complexes can have beautiful colors. The color given off by a coordination complex depends on the nature of the transition metal and the nature of the ligands. Crystal field theory can be used to explain the observed colors of various coordination complexes.

Spectrochemical Series -relative abilities of common ligands to split the d-orbital energy levels.

Strong field ligands - produce large energy separations between d-orbitals

Weak field ligands - produce small energy separations between d-orbitals

$I^{-} < Br^{-} < CI^{-} \qquad $	$\langle NH_3 \langle CO \langle CN^2 \rangle$
weak field ligands	strong field ligands
Δ_{o} small	Δ_{o} is large
High spin	Low spin

Spectrochemical Series (Octahedral Example)

Consider Fe^{3+} in two different compounds: high spin $[\text{Fe}(\text{H}_2\text{O})_6]^{3+}$ and low spin $[\text{Fe}(\text{CN})_6]^{3-}$.

d count = ?

$$\frac{\overline{d_{x^2-y^2}}}{\overline{d_{xy}}} \frac{\overline{d_{z^2}}}{\overline{d_{xz}}} \oint_{(t_{2g})}^{(e_g)} \oint_{(t_{2g})}^{+\frac{3}{5}} \Delta_0$$

high spin

 Fe^{3+} in $[Fe(H_2O)_6]^{3+}$

$$\frac{\overline{d_{x^{2} \cdot y^{2}}}}{d_{xy}} = \frac{\overline{d_{z^{2}}}}{d_{xz}} + \frac{e_{g}}{\Delta_{O}} + \frac{3}{5} + \frac{5}{5} + \frac{1}{5} + \frac{1}{$$

low spin

$$Fe^{3+}$$
 in $[Fe(CN)_6]^{3-}$

CFSE =

Light Absorbed by Octahedral Coordination Complexes

A substance absorbs photons of light if the energies of the photons match the energies required to excite the electrons to higher energy levels.

$E_{light} = hv = \Delta_{o}$	E = energy of light absorbed
0	h = planck's constant
	v = frequency
	Δ_{o} = octahedral crystal field splitting energy

If high frequency light is absorbed, the wavelength of the absorbed light is _____.

$$c=\lambda v$$
 $c = speed of light$
 $\lambda = wavelength$
 $v = frequency$

<u>Going back to our example:</u> high spin $[Fe(H_2O)_6]^{3+}$ and low spin $[Fe(CN)_6]^{3-}$ High spin $[Fe(H_2O)_6]^{3+}$ has a crystal field splitting energy of 171 kJ/mol Low spin $[Fe(CN)_6]^{3-}$ has a crystal field splitting energy of 392 kJ/mol

Calculate the wavelength of light absorbed by both complexes.

High spin [Fe(H₂O)₆]³⁺

 $\lambda = c/v \text{ and } v = \Delta_o/h$ so $\lambda = hc/\Delta_o = \frac{(6.626 \text{ x } 10^{-34} \text{ J s})(2.997 \text{ x } 10^8 \text{ m/s})}{(171 \text{ kJ/mol})(1000 \text{ J/kJ})(1 \text{ mol/}6.022 \text{ x } 10^{23})} = 7.00 \text{ x } 10^{-7} \text{ m or } 700. \text{ nm}$

 $[Fe(H_2O)_6]^{3+}$ absorbs red light

Low spin [Fe(CN)₆]³⁻

$$\lambda = hc/\Delta_{o} = \frac{(6.626 \text{ x } 10^{-34} \text{ J s})(2.997 \text{ x } 10^8 \text{ m/s})}{(392 \text{ kJ/mol})(1000 \text{ J/kJ})(1 \text{ mol}/6.022 \text{ x } 10^{23})} = 3.05 \text{ x } 10^{-7} \text{ m or } 305. \text{ nm}$$

[Fe(CN)₆]³⁻ absorbs violet light

Example: Explain the different colors of
$$[Cr(H_2O)_6]^{3+}$$
 and $[Cr(NH_3)_6]^{3+}$?
[$Cr(H_2O)_6]^{3+}$ [$Cr(NH_3)_6]^{3+}$ oxidation number of Cr?

d count?

CN?

Type of Ligand?

 Cr^{3+} in $[Cr(H_2O)_6]^{3+}$

Octahedral Crystal Field Splitting Diagrams:

$$\overline{d_{x^{2}-y^{2}}}^{2} \overline{d_{z}^{2}} \qquad \left(\begin{array}{c} e_{g} \\ A_{g} \\ A_{g} \\ A_{xy} \\ A_{xz} \\ A_{yz} \\ A_{yz} \end{array} \right) \left(\begin{array}{c} e_{g} \\ A_{g} \\ A_{g} \\ A_{g} \\ A_{z} \\ A_{yz} \\ A_{zz} \\ A_{yz} \\ A_{zz} \\ A_{zz$$

$$\overline{\mathbf{d}_{x^{2} \cdot y^{2}}} \quad \overline{\mathbf{d}_{z^{2}}} \quad \left(\begin{array}{c} (\mathbf{e}_{g}) \\ \bigtriangleup_{O} \end{array} \right) \quad \left(\begin{array}{c} + 3 \\ + 3 \\ \bigtriangleup_{O} \end{array} \right) \quad \left(\begin{array}{c} + 3 \\ - 5 \\ \swarrow_{O} \end{array} \right) \quad \left(\begin{array}{c} -2 \\ 5 \\ - 5 \end{array} \right) \quad \left(\begin{array}{c} -2 \\ -2 \end{array} \right) \quad \left(\begin{array}{c} -2 \\ -2 \end{array} \right) \quad \left(\begin{array}{c} -2 \\ -2 \end{array} \right) \quad \left($$

Cr³⁺ in [Cr(NH₃)₆]³⁺

$(\Delta_{o} \text{ is smalle})$	r)			$(\Delta_{o} \text{ is larger})$)	
Δ_{o} =	E =	hv		Δ_{o} =	E = hv	
smaller Δ_0	lower E	frequency absorbed		larger Δ_{o}	higher E	frequency absorbed
c/v =	λ			c/v =	λ	
lower				higher		
frequency	wavelength			frequency	wavelength	
absorbed	absorbed			absorbed	absorbed	
violet	blue	green	yellow	orange	red	
		I				
λ 400nm	430nm	490nm	560nm	580nm	620nm	800nm

 H_2O is a weak to intermediate field ligand (Δ_o is smaller)

 NH_3 is a stronger field ligand (Δ_o is larger)

Color of transmitted light is complementary to the color of absorbed light. Violet is complementary to yellow; blue is complementary to orange; green is complementary to red.

Estimate crystal field splitting energy in kJ/molExample $[CrCl_6]^{3-}$ wavelength of most intensely absorbed light is 740 nm

predicted color:

frequency of light absorbed is $c/\lambda = (2.997 \text{ x } 10^8 \text{ m/s})/(740 \text{ x } 10^{-9} \text{ m}) = 4.05 \text{ x } 10^{14} \text{ s}^{-1}$

crystal field splitting energy Δ_o is hv = (6.626 x 10⁻³⁴ J s)(4.05 x 10¹⁴ s⁻¹) = 2.68 x 10⁻¹⁹ J

 $(2.68 \text{ x } 10^{-19} \text{ J}) \text{ x} (1 \text{ kJ}/1000 \text{ J}) \text{ x} (6.022 \text{ x } 10^{23} \text{ mol}^{-1}) = 160 \text{ kJ/mol}$

Which coordination complexes are colorless?

All d-orbitals are _____. No d-d transitions in the visible range possible.

Examples. Zn^{2+} and Cd^{2+}

Color in Octahedral Coordination Complexes Summary

<u>Ligands</u>	$I^{-} < Br^{-} < CI^{-} \qquad weak field ligands$	<NH ₃ $<$ CO $<$ CN ⁻ strong field ligands
	Δ_{\circ} small	$\Delta_{ m o}$ is large
	High spin	Low spin
Complexes		-
Absorb	low energy photons	high energy photons
	low frequency (v)	high frequency (v)
	long wavelength (λ)	short wavelength (λ)
	(yellow/orange/red end of spectra)	(violet/blue/green end of spectra)
Complexes	<u>}</u>	
<u>Transmit</u>	Complementary to absorbed (violet/blue/green end of spectra)	Complementary to absorbed (yellow/orange/red end of spectra)

Violet is complementary to yellow; orange is complementary to blue; red is complementary to green.

Cobalt containing coordination complexes display a wide variety of colors Which vitamin contains cobalt?
