Strong law of large numbers

Jensen's inequality

▶ Pedro is considering two ways to invest his life savings.

- Pedro is considering two ways to invest his life savings.
- One possibility: put the entire sum in government insured interest-bearing savings account. He considers this completely risk free. The (post-tax) interest rate equals the inflation rate, so the real value of his savings is guaranteed not to change.

- Pedro is considering two ways to invest his life savings.
- One possibility: put the entire sum in government insured interest-bearing savings account. He considers this completely risk free. The (post-tax) interest rate equals the inflation rate, so the real value of his savings is guaranteed not to change.
- Riskier possibility: put sum in investment where every month real value goes up 15 percent with probability .53 and down 15 percent with probability .47 (independently of everything else).

- Pedro is considering two ways to invest his life savings.
- ➤ One possibility: put the entire sum in government insured interest-bearing savings account. He considers this completely risk free. The (post-tax) interest rate equals the inflation rate, so the real value of his savings is guaranteed not to change.
- Riskier possibility: put sum in investment where every month real value goes up 15 percent with probability .53 and down 15 percent with probability .47 (independently of everything else).
- ► How much does Pedro make in expectation over 10 years with risky approach? 100 years?

► How much does Pedro make in expectation over 10 years with risky approach? 100 years?

- ► How much does Pedro make in expectation over 10 years with risky approach? 100 years?
- ► Answer: let *R_i* be i.i.d. random variables each equal to 1.15 with probability .53 and .85 with probability .47. Total value after *n* steps is initial investment times

$$T_n := R_1 \times R_2 \times \ldots \times R_n.$$

- ► How much does Pedro make in expectation over 10 years with risky approach? 100 years?
- Answer: let R_i be i.i.d. random variables each equal to 1.15 with probability .53 and .85 with probability .47. Total value after n steps is initial investment times $T_n := R_1 \times R_2 \times ... \times R_n$.
- ► Compute $E[R_1] = .53 \times 1.15 + .47 \times .85 = 1.009$.

- ► How much does Pedro make in expectation over 10 years with risky approach? 100 years?
- Answer: let R_i be i.i.d. random variables each equal to 1.15 with probability .53 and .85 with probability .47. Total value after n steps is initial investment times $T_n := R_1 \times R_2 \times \ldots \times R_n$.
- ► Compute $E[R_1] = .53 \times 1.15 + .47 \times .85 = 1.009$.
- ► Then $E[T_{120}] = 1.009^{120} \approx 2.93$. And $E[T_{1200}] = 1.009^{1200} \approx 46808.9$

How would you advise Pedro to invest over the next 10 years if Pedro wants to be completely sure that he doesn't lose money?

- How would you advise Pedro to invest over the next 10 years if Pedro wants to be completely sure that he doesn't lose money?
- What if Pedro is willing to accept substantial risk if it means there is a good chance it will enable his grandchildren to retire in comfort 100 years from now?

- How would you advise Pedro to invest over the next 10 years if Pedro wants to be completely sure that he doesn't lose money?
- What if Pedro is willing to accept substantial risk if it means there is a good chance it will enable his grandchildren to retire in comfort 100 years from now?
- What if Pedro wants the money for himself in ten years?

- ► How would you advise Pedro to invest over the next 10 years if Pedro wants to be completely sure that he doesn't lose money?
- What if Pedro is willing to accept substantial risk if it means there is a good chance it will enable his grandchildren to retire in comfort 100 years from now?
- What if Pedro wants the money for himself in ten years?
- Let's do some simulations.

▶ We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.

- ▶ We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.
- Now S_n is a sum of i.i.d. random variables.

- We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.
- Now S_n is a sum of i.i.d. random variables.
- $E[X_1] = E[\log R_1] = .53(\log 1.15) + .47(\log .85) \approx -.0023.$

- ▶ We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.
- Now S_n is a sum of i.i.d. random variables.
- $E[X_1] = E[\log R_1] = .53(\log 1.15) + .47(\log .85) \approx -.0023.$
- ▶ By the law of large numbers, if we take n extremely large, then $S_n/n \approx -.0023$ with high probability.

- ▶ We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.
- Now S_n is a sum of i.i.d. random variables.
- $E[X_1] = E[\log R_1] = .53(\log 1.15) + .47(\log .85) \approx -.0023.$
- ▶ By the law of large numbers, if we take n extremely large, then $S_n/n \approx -.0023$ with high probability.
- ▶ This means that, when n is large, S_n is usually a very negative value, which means T_n is usually very close to zero (even though its expectation is very large).

- ▶ We wrote $T_n = R_1 \times ... \times R_n$. Taking logs, we can write $X_i = \log R_i$ and $S_n = \log T_n = \sum_{i=1}^n X_i$.
- Now S_n is a sum of i.i.d. random variables.
- ► $E[X_1] = E[\log R_1] = .53(\log 1.15) + .47(\log .85) \approx -.0023.$
- ▶ By the law of large numbers, if we take n extremely large, then $S_n/n \approx -.0023$ with high probability.
- ▶ This means that, when n is large, S_n is usually a very negative value, which means T_n is usually very close to zero (even though its expectation is very large).
- ▶ Bad news for Pedro's grandchildren. After 100 years, the portfolio is probably in bad shape. But what if Pedro takes an even longer view? Will T_n converge to zero with probability one as n gets large? Or will T_n perhaps always eventually rebound?

Strong law of large numbers

Jensen's inequality

Outline

A story about Pedro

Strong law of large numbers

Jensen's inequality

▶ Suppose X_i are i.i.d. random variables with mean μ .

- ▶ Suppose X_i are i.i.d. random variables with mean μ .
- ► Then the value $A_n := \frac{X_1 + X_2 + ... + X_n}{n}$ is called the *empirical average* of the first n trials.

- ▶ Suppose X_i are i.i.d. random variables with mean μ .
- ► Then the value $A_n := \frac{X_1 + X_2 + ... + X_n}{n}$ is called the *empirical average* of the first n trials.
- ▶ Intuition: when n is large, A_n is typically close to μ .

- ▶ Suppose X_i are i.i.d. random variables with mean μ .
- ► Then the value $A_n := \frac{X_1 + X_2 + ... + X_n}{n}$ is called the *empirical average* of the first n trials.
- ▶ Intuition: when n is large, A_n is typically close to μ .
- ▶ Recall: weak law of large numbers states that for all $\epsilon > 0$ we have $\lim_{n\to\infty} P\{|A_n \mu| > \epsilon\} = 0$.

- ▶ Suppose X_i are i.i.d. random variables with mean μ .
- ► Then the value $A_n := \frac{X_1 + X_2 + ... + X_n}{n}$ is called the *empirical average* of the first n trials.
- ▶ Intuition: when n is large, A_n is typically close to μ .
- ▶ Recall: weak law of large numbers states that for all $\epsilon > 0$ we have $\lim_{n\to\infty} P\{|A_n \mu| > \epsilon\} = 0$.
- ► The **strong law of large numbers** states that with probability one $\lim_{n\to\infty} A_n = \mu$.

- ▶ Suppose X_i are i.i.d. random variables with mean μ .
- ► Then the value $A_n := \frac{X_1 + X_2 + ... + X_n}{n}$ is called the *empirical average* of the first n trials.
- ▶ Intuition: when n is large, A_n is typically close to μ .
- ▶ Recall: weak law of large numbers states that for all $\epsilon > 0$ we have $\lim_{n\to\infty} P\{|A_n \mu| > \epsilon\} = 0$.
- ► The **strong law of large numbers** states that with probability one $\lim_{n\to\infty} A_n = \mu$.
- It is called "strong" because it implies the weak law of large numbers. But it takes a bit of thought to see why this is the case.

▶ Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.

- ▶ Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.
- Strong law implies that for every ϵ the random variable $Y_{\epsilon} = \max\{n : |A_n \mu| > \epsilon\}$ is finite with probability one. It has some probability mass function (though we don't know what it is).

- Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.
- Strong law implies that for every ϵ the random variable $Y_{\epsilon} = \max\{n: |A_n \mu| > \epsilon\}$ is finite with probability one. It has some probability mass function (though we don't know what it is).
- ▶ Note that if $|A_n \mu| > \epsilon$ for some *n* value then $Y_{\epsilon} \ge n$.

- Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.
- Strong law implies that for every ϵ the random variable $Y_{\epsilon} = \max\{n: |A_n \mu| > \epsilon\}$ is finite with probability one. It has some probability mass function (though we don't know what it is).
- ▶ Note that if $|A_n \mu| > \epsilon$ for some n value then $Y_{\epsilon} \ge n$.
- ▶ Thus for each n we have $P\{|A_n \mu| > \epsilon\} \le P\{Y_{\epsilon} \ge n\}$.

- Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.
- Strong law implies that for every ϵ the random variable $Y_{\epsilon} = \max\{n: |A_n \mu| > \epsilon\}$ is finite with probability one. It has some probability mass function (though we don't know what it is).
- ▶ Note that if $|A_n \mu| > \epsilon$ for some n value then $Y_{\epsilon} \ge n$.
- ▶ Thus for each n we have $P\{|A_n \mu| > \epsilon\} \le P\{Y_{\epsilon} \ge n\}$.
- ▶ So $\lim_{n\to\infty} P\{|A_n \mu| > \epsilon\} \le \lim_{n\to\infty} P\{Y_{\epsilon} \ge n\} = 0$.

- Suppose we know that the strong law holds, i.e., with probability 1 we have $\lim_{n\to\infty} A_n = \mu$.
- Strong law implies that for every ϵ the random variable $Y_{\epsilon} = \max\{n: |A_n \mu| > \epsilon\}$ is finite with probability one. It has some probability mass function (though we don't know what it is).
- ▶ Note that if $|A_n \mu| > \epsilon$ for some n value then $Y_{\epsilon} \ge n$.
- ▶ Thus for each n we have $P\{|A_n \mu| > \epsilon\} \le P\{Y_{\epsilon} \ge n\}$.
- ► So $\lim_{n\to\infty} P\{|A_n \mu| > \epsilon\} \le \lim_{n\to\infty} P\{Y_{\epsilon} \ge n\} = 0$.
- ▶ If the right limit is zero for each ϵ (strong law) then the left limit is zero for each ϵ (weak law).

Proof of strong law assuming $E[X^4] < \infty$

▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.
- ▶ Key to proof is to bound fourth moments of A_n .

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.
- ▶ Key to proof is to bound fourth moments of A_n .
- $E[A_n^4] = n^{-4} E[S_n^4] = n^{-4} E[(X_1 + X_2 + \ldots + X_n)^4].$

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.
- ▶ Key to proof is to bound fourth moments of A_n .
- $E[A_n^4] = n^{-4} E[S_n^4] = n^{-4} E[(X_1 + X_2 + \ldots + X_n)^4].$
- ▶ Expand $(X_1 + ... + X_n)^4$. Five kinds of terms: $X_i X_j X_k X_l$ and $X_i X_j X_k^2$ and $X_i X_j^3$ and $X_i^2 X_j^2$ and X_i^4 .

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.
- ▶ Key to proof is to bound fourth moments of A_n .
- $E[A_n^4] = n^{-4} E[S_n^4] = n^{-4} E[(X_1 + X_2 + \ldots + X_n)^4].$
- ▶ Expand $(X_1 + ... + X_n)^4$. Five kinds of terms: $X_i X_j X_k X_l$ and $X_i X_j X_k^2$ and $X_i X_j^3$ and $X_i^2 X_j^2$ and X_i^4 .
- ▶ The first three terms all have expectation zero. There are $\binom{n}{2}$ of the fourth type and n of the last type, each equal to at most K. So $E[A_n^4] \leq n^{-4} \Big(6\binom{n}{2} + n \Big) K$.

- ▶ Assume $K := E[X^4] < \infty$. Not necessary, but simplifies proof.
- ▶ Note: $Var[X^2] = E[X^4] E[X^2]^2 > 0$, so $E[X^2]^2 \le K$.
- ▶ The strong law holds for i.i.d. copies of X if and only if it holds for i.i.d. copies of $X \mu$ where μ is a constant.
- ▶ So we may as well assume E[X] = 0.
- ▶ Key to proof is to bound fourth moments of A_n .
- $E[A_n^4] = n^{-4}E[S_n^4] = n^{-4}E[(X_1 + X_2 + \ldots + X_n)^4].$
- ▶ Expand $(X_1 + ... + X_n)^4$. Five kinds of terms: $X_i X_j X_k X_l$ and $X_i X_j X_k^2$ and $X_i^2 X_i^3$ and $X_i^2 X_i^2$ and X_i^4 .
- ▶ The first three terms all have expectation zero. There are $\binom{n}{2}$ of the fourth type and n of the last type, each equal to at most K. So $E[A_n^4] \leq n^{-4} \Big(6\binom{n}{2} + n \Big) K$.
- ▶ Thus $E[\sum_{n=1}^{\infty} A_n^4] = \sum_{n=1}^{\infty} E[A_n^4] < \infty$. So $\sum_{n=1}^{\infty} A_n^4 < \infty$ (and hence $A_n \to 0$) with probability 1.
